Chapter 4: Network Layer

Chapter goals:

- understand principles behind network layer services:
 - network layer service models
 - forwarding versus routing
 - how a router works
 - routing (path selection)
 - dealing with scale
 - advanced topics: IPv6, mobility
- instantiation, implementation in the Internet

Chapter 4: Network Layer

Part 1

□ Introduction

- IP: Internet Protocol
 - Datagram format
 - IPv4 addressing
 - ICMP

Part 2

- IPv6
- NAT and NAT Traversal
- Virtual circuit and datagram networks
- What's inside a router

Part 3

- Routing algorithms
 - Link state
 - Distance Vector
 - Hierarchical routing
- Routing in the Internet
 - RIP
 - OSPF
 - BGP
- Broadcast and multicast routing

Network layer

- ❑ transport segment from sending to receiving host
- ❑ on sending side encapsulates segments into datagrams
- ❑ on rcving side, delivers segments to transport layer
- ❑ network layer protocols in *every* host, router
- ❑ router examines header fields in all IP datagrams passing through it

Two Key Network-Layer Functions

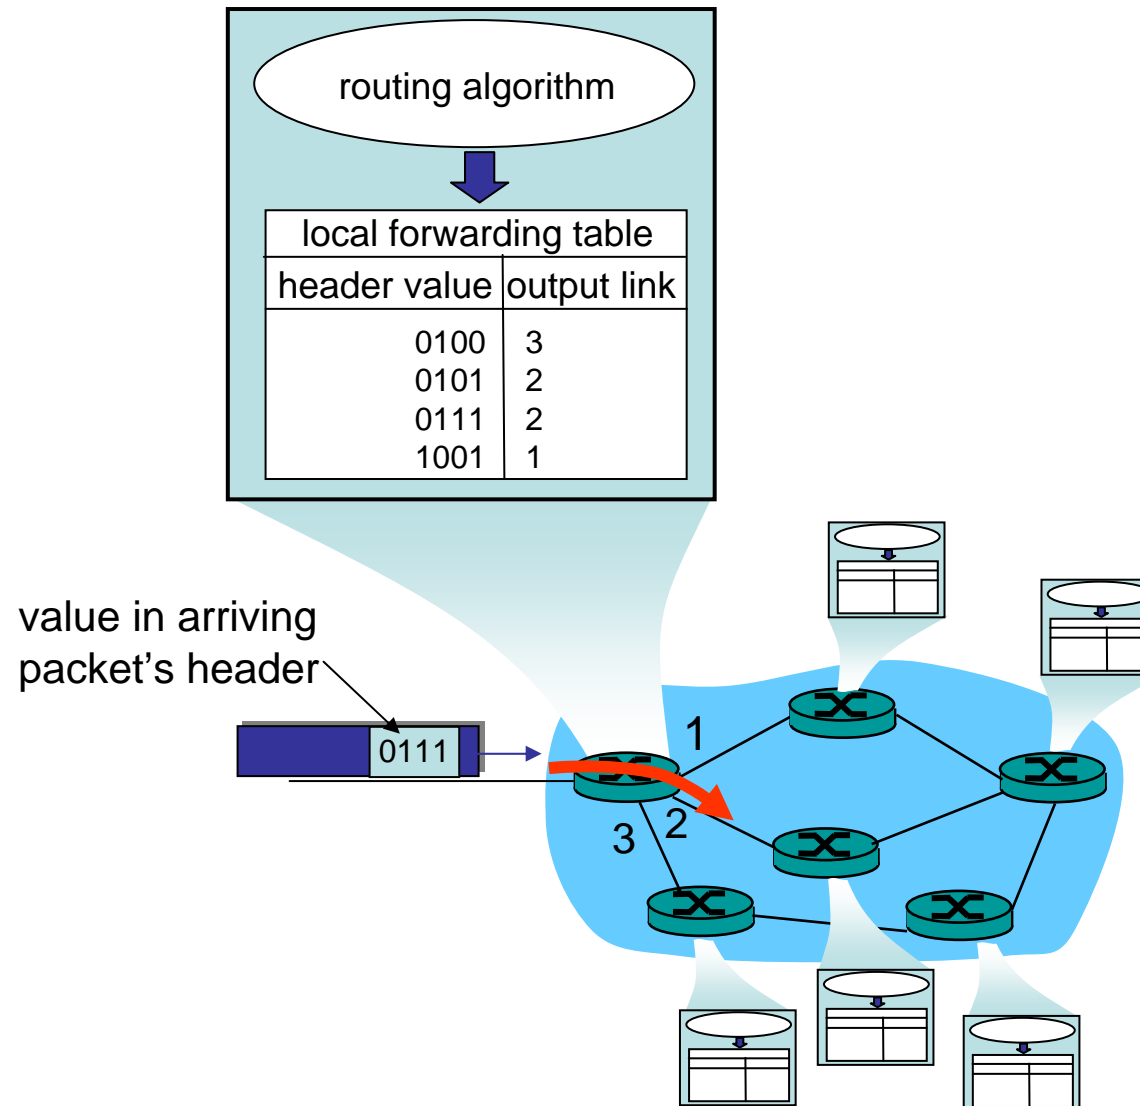

- *routing*: determine route taken by packets from source to dest.
 - *routing algorithms*
- *forwarding*: move packets from router's input to appropriate router output

analogy:

- *routing*: process of planning trip from source to dest
- *forwarding*: process of getting through single interchange

Interplay between routing and forwarding

Datagram networks

- no call setup at network layer
- routers: no state about end-to-end connections
 - no network-level concept of “connection”
- packets forwarded using destination host address
 - packets between same source-dest pair may take different paths

Forwarding table

4 billion possible entries

<u>Destination Address Range</u>	<u>Link Interface</u>
11001000 00010111 00010000 00000000 through 11001000 00010111 00010111 11111111	0
11001000 00010111 00011000 00000000 through 11001000 00010111 00011000 11111111	1
11001000 00010111 00011001 00000000 through 11001000 00010111 00011111 11111111	2
otherwise	3

Longest prefix matching

<u>Prefix Match</u>	<u>Link Interface</u>
11001000 00010111 00010	0
11001000 00010111 00011000	1
11001000 00010111 00011	2
otherwise	3

Examples

DA: 11001000 00010111 00010110 10100001 Which interface?

DA: 11001000 00010111 00011000 10101010 Which interface?

Chapter 4: Network Layer

Part 1

- Introduction
- **IP: Internet Protocol**
 - Datagram format
 - IPv4 addressing
 - ICMP

Part 2

- IPv6
- NAT and NAT Traversal
- Virtual circuit and datagram networks
- What's inside a router

Part 3

- Routing algorithms
 - Link state
 - Distance Vector
 - Hierarchical routing
- Routing in the Internet
 - RIP
 - OSPF
 - BGP
- Broadcast and multicast routing

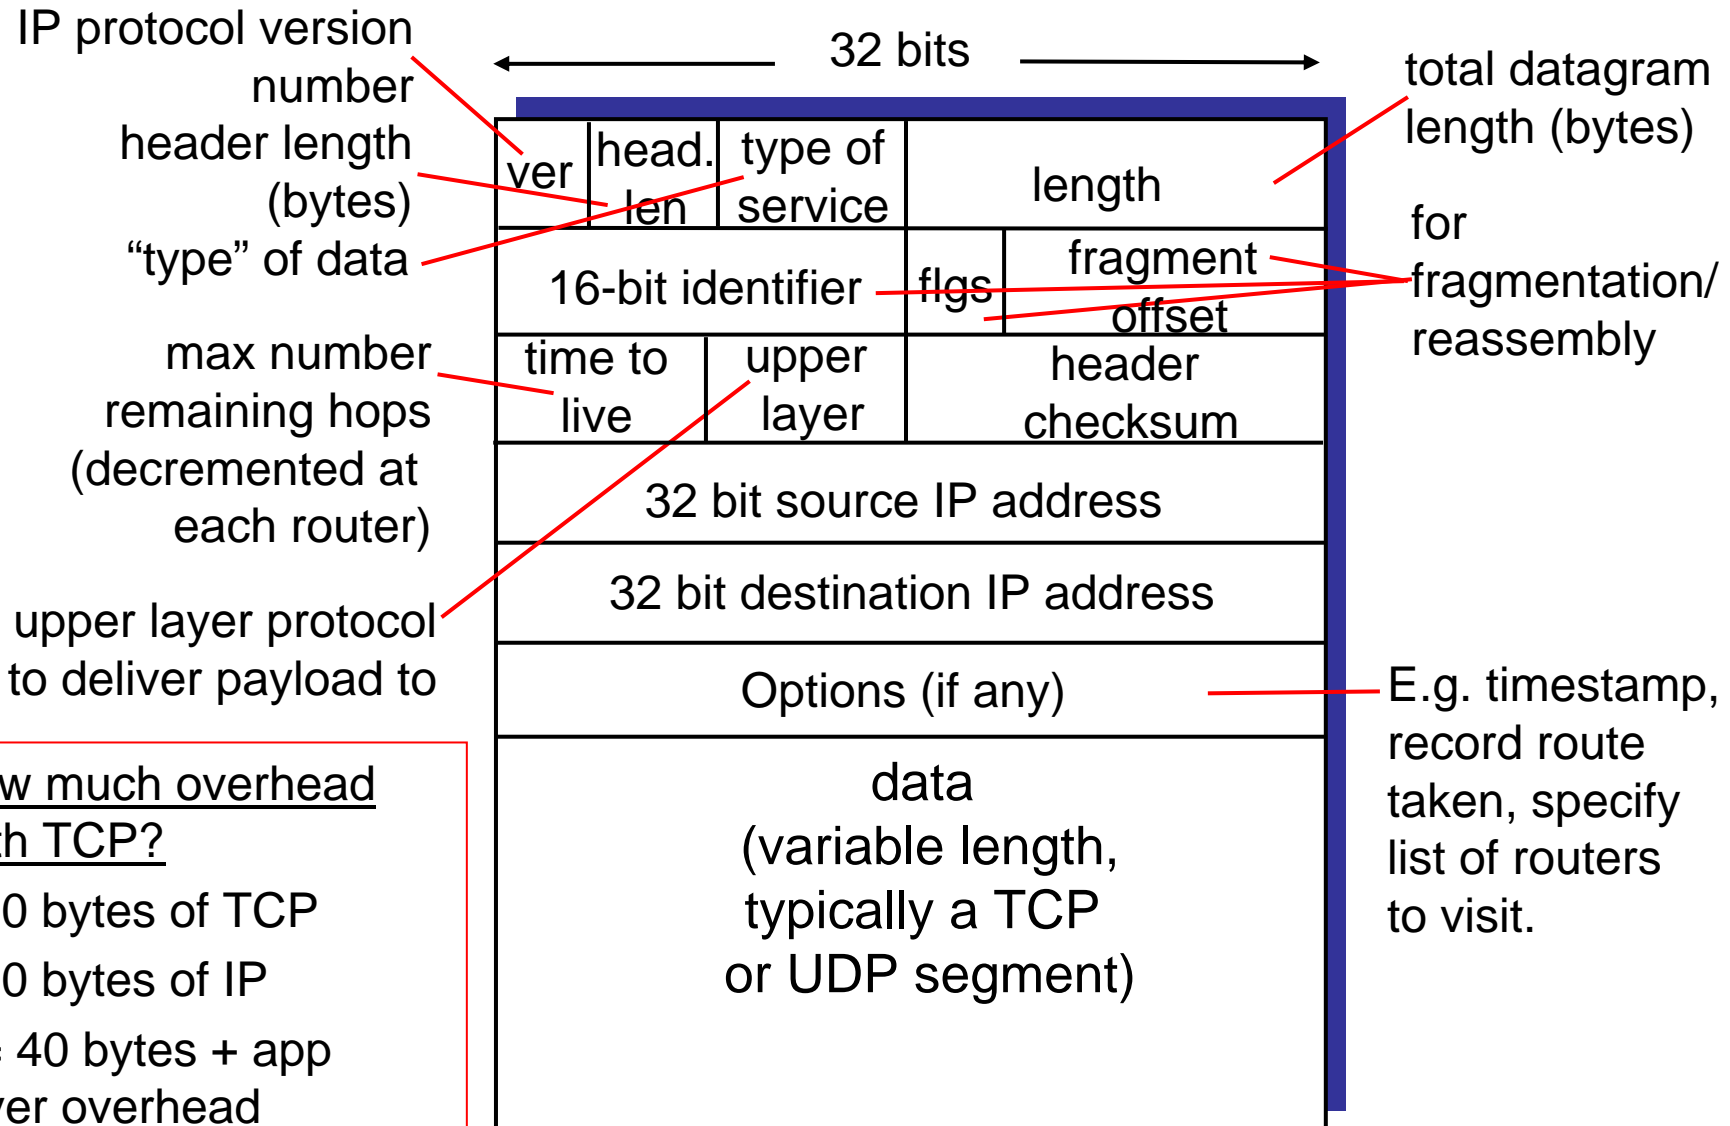

The Internet Network layer

Host, router network layer functions:

IP datagram format

how much overhead with TCP?

- 20 bytes of TCP
- 20 bytes of IP
- = 40 bytes + app layer overhead

IP Fragmentation & Reassembly

- network links have MTU (max.transfer size) - largest possible link-level frame.
 - different link types, different MTUs
- large IP datagram divided (“fragmented”) within net
 - one datagram becomes several datagrams
 - “reassembled” only at final destination
 - IP header bits used to identify, order related fragments

IP Fragmentation and Reassembly

Example

- 4000 byte datagram
- MTU = 1500 bytes

	length	ID	fragflag	offset	
	=4000	=x	=0	=0	

One large datagram becomes several smaller datagrams

1480 bytes in data field

offset = $1480/8$

	length	ID	fragflag	offset	
	=1500	=x	=1	=0	

	length	ID	fragflag	offset	
	=1500	=x	=1	=185	

	length	ID	fragflag	offset	
	=1040	=x	=0	=370	

Chapter 4: Network Layer

Part 1

- Introduction
- **IP: Internet Protocol**
 - Datagram format
 - **IPv4 addressing**
 - ICMP

Part 2

- IPv6
- NAT and NAT Traversal
- Virtual circuit and datagram networks
- What's inside a router

Part 3

- Routing algorithms
 - Link state
 - Distance Vector
 - Hierarchical routing
- Routing in the Internet
 - RIP
 - OSPF
 - BGP
- Broadcast and multicast routing

IP Addressing: introduction

- IP address: 32-bit identifier for host, router *interface*
- *interface*: connection between host/router and physical link
 - router's typically have multiple interfaces
 - host typically has one interface
 - IP addresses associated with each interface

$$223.1.1.1 = \underbrace{11011111}_{223} \underbrace{00000001}_1 \underbrace{00000001}_1 \underbrace{00000001}_1$$

Subnets

- IP address:
 - subnet part (high order bits)
 - host part (low order bits)
- *What's a subnet ?*
 - device interfaces with same subnet part of IP address
 - can physically reach each other without intervening router

network consisting of 3 subnets

Subnets

Recipe

- To determine the subnets, detach each interface from its host or router, creating islands of isolated networks. Each isolated network is called a **subnet**.

Subnet mask: /24

Subnets

How many?

IP addressing: CIDR

CIDR: Classless InterDomain Routing

- subnet portion of address of arbitrary length
- address format: **a.b.c.d/x**, where x is # bits in subnet portion of address

IP addresses: how to get one?

Q: How does a *host* get IP address?

- ❑ hard-coded by system admin in a file
 - Windows: control-panel->network->configuration->tcp/ip->properties
 - UNIX: /etc/rc.config
- ❑ **DHCP: D**ynamic **H**ost **C**onfiguration **P**rotocol: dynamically get address from as server
 - “plug-and-play”

DHCP: Dynamic Host Configuration Protocol

- **Goal:** allow host to dynamically obtain its IP address from network server when it joins network
 - Can renew its lease on address in use
 - Allows reuse of addresses (only hold address while connected an “on”)
 - Support for mobile users who want to join network (more shortly)
- DHCP overview:
 - host broadcasts “DHCP discover” msg
 - DHCP server responds with “DHCP offer” msg
 - host requests IP address: “DHCP request” msg
 - DHCP server sends address: “DHCP ack” msg

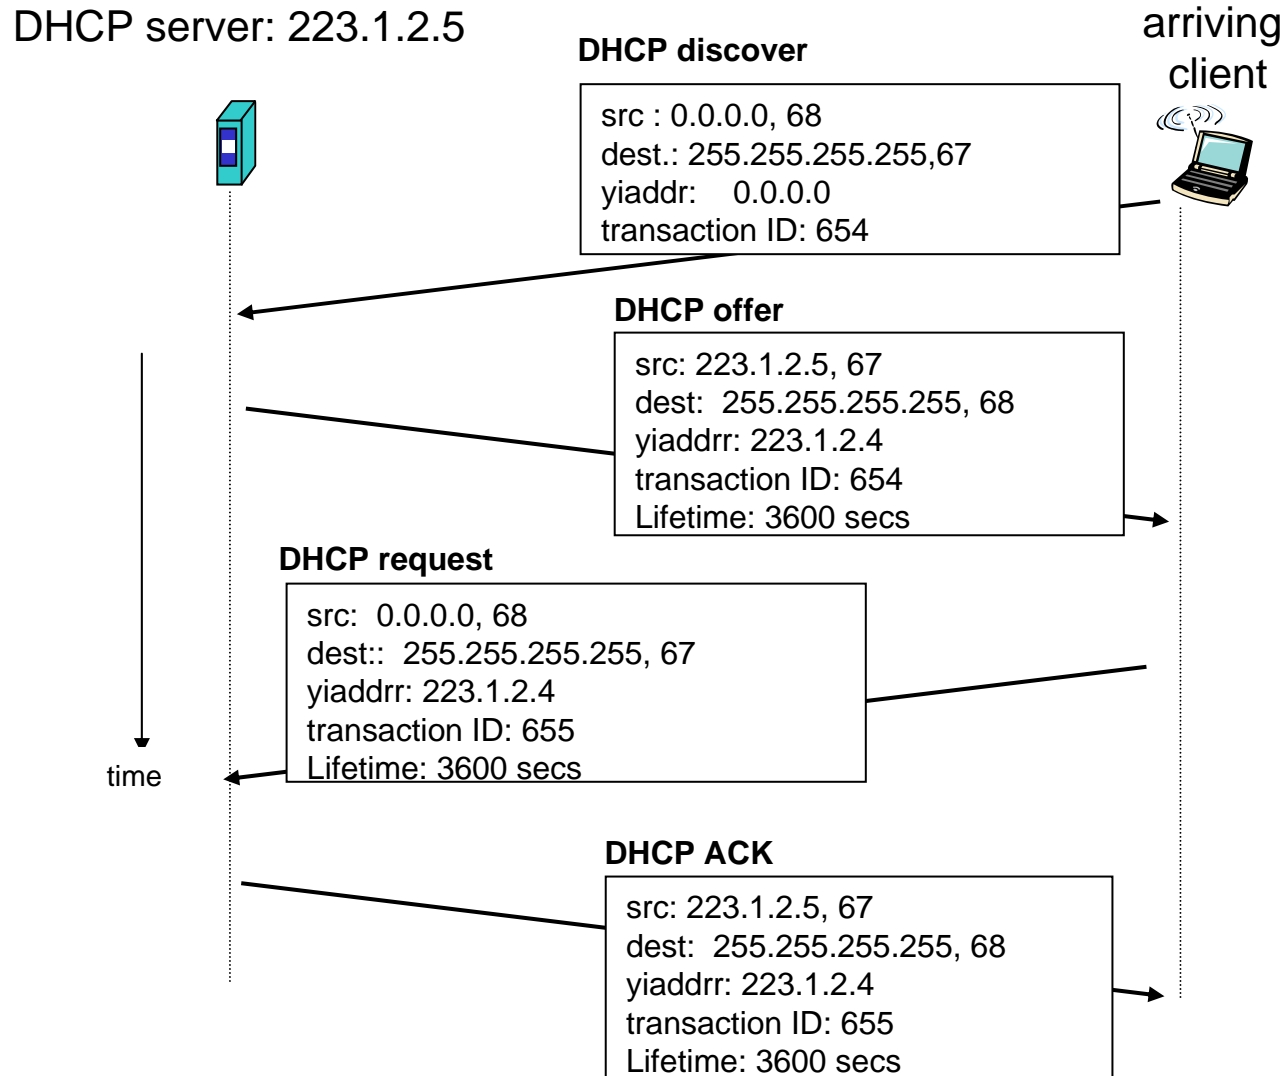

DHCP client-server scenario

DHCP client-server scenario

IP addresses: how to get one?

Q: How does *network* get subnet part of IP addr?

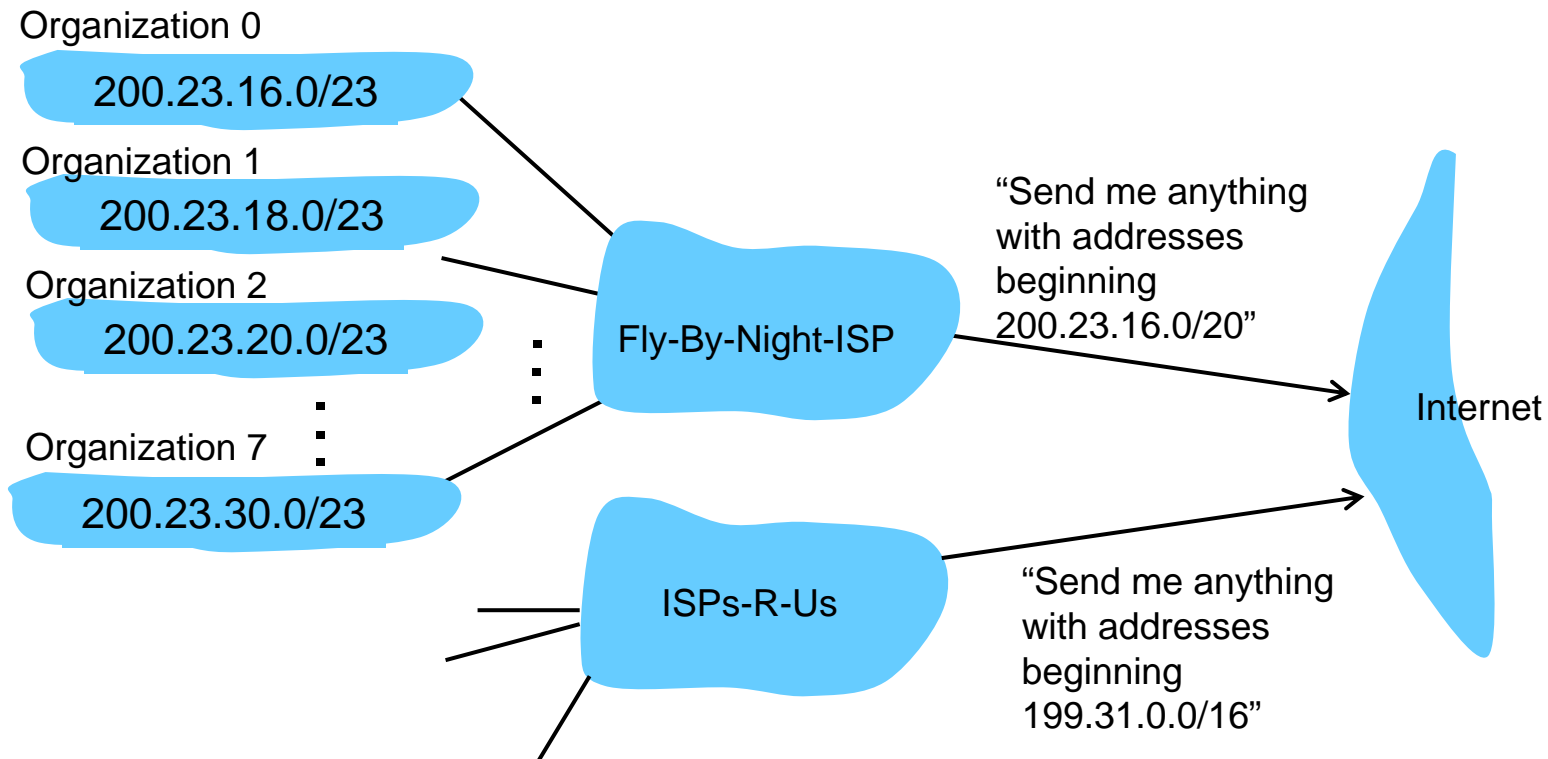

A: gets allocated portion of its provider ISP's address space

ISP's block	<u>11001000</u>	<u>00010111</u>	<u>00010000</u>	00000000	200.23.16.0/20
Organization 0	<u>11001000</u>	<u>00010111</u>	<u>00010000</u>	00000000	200.23.16.0/23
Organization 1	<u>11001000</u>	<u>00010111</u>	<u>00010010</u>	00000000	200.23.18.0/23
Organization 2	<u>11001000</u>	<u>00010111</u>	<u>00010100</u>	00000000	200.23.20.0/23
...
Organization 7	<u>11001000</u>	<u>00010111</u>	<u>00011110</u>	00000000	200.23.30.0/23

Hierarchical addressing: route aggregation

Hierarchical addressing allows efficient advertisement of routing information:

Hierarchical addressing: more specific routes

ISPs-R-Us has a more specific route to Organization 1

IP addressing: the last word...

Q: How does an ISP get block of addresses?

A: **ICANN**: Internet **C**orporation for **A**ssigned
Names and **N**umbers

- allocates addresses
- manages DNS
- assigns domain names, resolves disputes

Chapter 4: Network Layer

Part 1

- Introduction
- **IP: Internet Protocol**
 - Datagram format
 - IPv4 addressing
 - **ICMP**

Part 2

- IPv6
- NAT and NAT Traversal
- Virtual circuit and datagram networks
- What's inside a router

Part 3

- Routing algorithms
 - Link state
 - Distance Vector
 - Hierarchical routing
- Routing in the Internet
 - RIP
 - OSPF
 - BGP
- Broadcast and multicast routing

ICMP: Internet Control Message Protocol

- used by hosts & routers to communicate network-level information
 - error reporting: unreachable host, network, port, protocol
 - echo request/reply (used by ping)
- network-layer “above” IP:
 - ICMP msgs carried in IP datagrams
- **ICMP message:** type, code plus first 8 bytes of IP datagram causing error

<u>Type</u>	<u>Code</u>	<u>description</u>
0	0	echo reply (ping)
3	0	dest. network unreachable
3	1	dest host unreachable
3	2	dest protocol unreachable
3	3	dest port unreachable
3	6	dest network unknown
3	7	dest host unknown
4	0	source quench (congestion control - not used)
8	0	echo request (ping)
9	0	route advertisement
10	0	router discovery
11	0	TTL expired
12	0	bad IP header

Traceroute and ICMP

- Source sends series of UDP segments to dest
 - First has TTL =1
 - Second has TTL=2, etc.
 - Unlikely port number
 - When nth datagram arrives to nth router:
 - Router discards datagram
 - And sends to source an ICMP message (type 11, code 0)
 - Message includes name of router & IP address
 - When ICMP message arrives, source calculates RTT
 - Traceroute does this 3 times
- Stopping criterion
- UDP segment eventually arrives at destination host
 - Destination returns ICMP “host unreachable” packet (type 3, code 3)
 - When source gets this ICMP, stops.
